

# Introduction of Fruit Collector

Fruit Collector revolutionizes all previous ideas about collecting fruit and removes worries about gathering the harvest.

Fruit Collector is secured around the fruit tree when the fruit harvest is ripening.

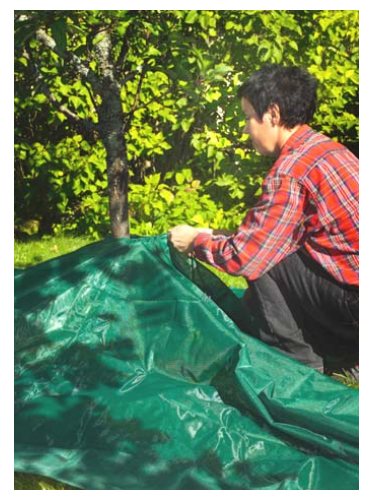

Fruit Collect is easy to erect and use.

The package contains FC fabric and eight pieces of metal rods.

The central opening in the fabric is tied around the trunk of the tree at a height of 40 – 50 cm (15 – 20 inches) above the ground.

The string is tightened and tied tightly around the trunk.

The Velcro strips are attached to each other, joining the fabric together.

## Introduction of Fruit Collector

The fabric is spread and stretched evenly around the tree.

The middle attachment loops at the corners and sides of the fabric are threaded through eyes of the support rods, first of all the upper loop to the upper eye and then the lower loop to the lower eye.

The support rods are pushed into the ground.

If necessary, the locations of the rods can be changed, to tighten the fabric and spread it evenly around the tree.

The fabric can be tightened using the additional loops. Two or all three loops can be fastened to the eye of the support rod.

In addition the fabric can be adjusted and tightened using the Velcro strips at the corners of the fabric.

The Fruit Collector fabric prevents the fruit from falling onto the ground and being bruised and dirtied. At the same time, the fruit is also protected from worms and other bugs. Fruit Collector is suitable for all kinds of fruit trees: apple, plum, pear, cherry, mandarin etc.

The Fruit Collector fabric allows wind and rain to pass through and is machine washable. In addition, Fruit Collector takes up only a small space when stored.
